AUTHOR: Radionov, B.G.

TITLE: A print-out receiver and contactless sensor for telemetering

PERIODICAL: Referativnyy zhurnal, Avtomatika, telemekhanika i vychislitel'naya tekhnika, no. 1, 1963, 56, abstract LA302 (In collection: Ispol'zovaniye gaza v nar. kh-ve, no. 1, Saratov, 1961, 77-84)

TEXT: A description is given of a telemetering apparatus with 10 control points. The development consists of a print-out receiver and a contactless sensor. The receiver consists of electrical and printer units. The apparatus permits interrogation of each control point every 30 min. Interrogation of all 10 control points takes 5 min. In the interval (25 min) between automatic interrogations, the controller is able to call up any control point on the telephone. The apparatus is designed for use in the maintenance of town gas main systems. It is stated that for this applica-

A print-out receiver ...

tion the pulse-time telemetering system proves the simplest and cheapest. The receiver is an assembly with relays and contacts which is set in motion by a synchronous motor. A contact disc with a slider connects the receiver in turn to each control point. A drum with a set of plastic cams is rotated by the same motor. The cams open and close the circuits of control relays which give out pulses. The cams generate the following pulses: one to set up the control point number, one to switch on the sensor, three for the controlled parameters of the gas, one for printing on paper tape and one to clear the indications; 7 pulses in all. The sequence of operation corresponds to a given sequence in the functions of the cams. A chopper transforms the pulse-time signal from the sensor into short pulse-code signals. The signal of maximum duration (7.5 sec) corresponds to 25 chopper pulses. The electrical circuit of the receiver provides for visual and aural warning signals which must operate when there are deviations from the prescribed parameters of the gas at the control point. The electrical circuit also provides a two-way telephone link and a switch for turning on the

Card 2/4

S/271/63/000/001/022/047  
D413/D308

A print-out receiver ...

receiver to interrogate on call. The receiver printer unit converts the electrical pulses from the sensor into mechanical motion of wheels which serve to print out the parameters of the gas on paper. When interrogation of all the control points is finished and the indications have been cleared, a special cam mounted on the shaft connecting the contact disc to the reduction gearing open-circuits the drive to the motor and stops it. At that point the warning circuit is activated, and signals may be generated showing deviations at control points from the prescribed parameters of the gas. In the case of a danger signal or for control purposes on the controller's initiative, a special switch is used to call up the control point. The same switch activates the receiver for the regular routine interrogations. The sensor operates as follows. A metallic screen is mounted between the coils of an oscillator. The screen is connected to a pointer which in turn is connected to the sensitive element. The instrument pointer is deflected proportionally to the parameter being measured. The screen swings out of the space between the coils, and the oscillator generates a pulse proportional in duration to the value of the parameter. A number of advantages.

are claimed for this sensor as against those currently in use. Detailed kinematic and electrical circuits are given for the assemblies, and the operation is described. 5 figures.

ACCESSION NR: AR4022435

intermediate memory as they are received. After the end of the experiment, the information is processed and sorted out by channels. The sorting unit is a 1024-channel analyzer with ferrite-core memory. The intermediate memory employs a 35-mm magnetic tape, on which 25 tracks are recorded simultaneously. With 25-track recording, the total number of memory channels can reach  $32 \times 10^6$ . The intermediate memory block includes an equalizing unit with five memory elements, which reduces the effective value of the instrument dead time to 80--100 microseconds. The program for reducing the experimental data makes it possible to monitor the preliminary results of the measurements by extraction of eight 128-channel pulse-height spectra. After a visual estimate of the spectra, the information is fed by cable directly to a "Kiev" computer. Yu. Semenov.

TOPIC TAGS: railway equipment, railway rolling stock, locomotive engineering, electronic equipment, semiconductor rectifier, electronic rectifier, electronic test equipment, electronic signal, electronic switch

PURPOSE AND COVERAGE: This book describes the design and structure of instruments used for the protection of semiconductor rectifiers of electric rolling stock of type EP7<sup>k</sup>, EP9, VL60<sup>k</sup> and VL80<sup>k</sup> and K. Operating and repair instructions are given based on their usage as they were tested in train depo of Gorkiy and North Caucasus Line. The book is intended for workers at train. depo's, which deal with the operation and repair of electric rolling stock with semiconductor rectifiers.

TITLE: Speeding up the Testing of Complex Panels by a Working Current (Uskoreniye proverki slozhnykh zashchit rabochim tokom)

PERIODICAL: Energetik, 1958, Nr 9, pp 30 (USSR)

ABSTRACT: To speed up the measurement of current circuits when testing a panel with a loading current, a special switching device may be used. This consists of several sets of terminals to which the measuring instrument can be connected by inserting a plug to spread apart the spring contacts until they touch the fixed contacts of the terminals on either side. Before testing begins, the terminals are connected by flexible wire to all the circuits on the panel which it is desired to check. There are 2 diagrams and 1 circuit diagram.

AUTHOR: Radionova, Ye. A.

TITLE: Response of cochlear nuclear neurons to acoustic signals of varying length

SOURCE: Zhurnal vysshey nervnoy deyatel'nosti, v. 15, no. 4, 1965, 739-742

TOPIC TAGS: experiment animal, audition, acoustic signal, neuron

ABSTRACT: The present study investigated the importance of signal duration in measuring response intensity by the number of impulses in the neurons responding to a given signal or by the number of neurons participating in the reaction. The reaction of 40 individual neurons of the cochlear duct (level II neurons in the auditory system) to signals of varying length was studied in cats under anesthesia (sodium amyta 70 mg/kg) by implanting electrodes. Three characteristic neuron reactions were considered: number of response impulses, reaction threshold, and latency period. Results showed that changes in the characteristic neuron reactions were consistently similar to acoustic signal duration changes, except for 3 neurons reacting to

Card 1/2

L 17899-66

ACCESSION NR: AP5021240

sound with the "on" effect with practically no impulse response to signal duration. Increasing signal length increased the number of impulses in the neuron and lowered the threshold for neuron reaction. With sufficiently high signal intensity or length, the latent reaction period did not depend upon its duration, and with threshold intensity this period increased with increasing length of signal. Increasing intensity or length of a signal shortens the latent period according to the exponential law. Thus, the length of acoustic signals influences both the number of impulses of individual neurons and the number of neurons involved. These findings concur with literature data.

TITLE: Electrophysiological study of neurons of the cochlear nucleus of the cat

SOURCE: Fiziologicheskiy zhurnal SSSR, v. 51, no. 4, 1965, 441-448

TOPIC TAGS: electrophysiology, cat, neuron

ABSTRACT: The reaction of neurons of the cochlear nucleus of cats in response to sound stimuli was studied by determining the electrical activity of the neurons. The distribution of neurons of the cochlear nucleus according to the level of spontaneous activity, the threshold of sensitivity, and the latent period was determined. The distribution of neurons of the dorsal part of the nucleus with respect to these three characteristics differed from that of the neurons of the ventral part. For the majority of neurons, the duration of the response corresponded to the duration of the signal and showed almost no dependence on the intensity of the latter. Some neurons, however, responded by a prolonged impulse discharge of greater duration than the signal; this type of response was due to cyclic connections between the neurons. A curve expressing the relationship between the threshold of the neuron reaction and the duration of the signal was plotted. The authors thank A.M. Markovich for technical assistance in carrying out the work. Orig. art. has: 4

TITLE: Vapor-Cooling System for Cupolas

PUBLICATION: Liteynoye Proizvodstvo, 1959, Nr 4, pp 14-15 (USSR)

ABSTRACT:

In the course of an intensification of the cupola melting process of cast iron, it is very important to improve the cooling of the housing, in order to raise the durability of the inner fireproof casing and to enlarge the diameter of the melting belt. Water cooling of the cupola melting belt is already introduced in the Moscow Likhachev Auto Plant, in the Rostov agricultural machine works, and in a number of other big plants. With a decrease in thickness of the inner casing, the consumption of fireproof material is reduced, although more heat is lost in the cooling water, which means a raise in coke consumption. The specific losses of heat through water cooling amount to 14,800 kcal/t, if the inner casing is missing. They only total 1,000 kcal/t, if there

Card 1/3

Vapor-Cooling System for Cupolas

SOV/128-59-4-3/27

is an inner casing. With a cupola efficiency of 30%, the additional coke consumption resulting from the cooling amounts to 7.5 kg/t. Water cooling makes it possible to increase the dimension of the cupolas and to raise their output. This cooling system, however, is deficient in several respects: the water consumption is very considerable, which is unprofitable in the engine building plants; minerals are precipitated from the cooling water and form sediments and deposits with the result, that the housing warps and burns through. At the present time the metallurgic industry mainly uses evaporative cooling. The general idea of this method is, that the heat abstracted through the cooling water is used for its evaporation. Since the vaporization heat amounts to about 540 kcal/kg, the water consumption for the cooling is reduced to a large extent, and it is possible to use chemically purified water which does not cause an incrustation of boiler scale. A project for evaporative

Card 2/3

Vapor-Cooling System for Cupolas

SOV/128-59-4-8/27

cooling of a group of four cupolas is just being put into practice. Current can be saved with evaporative cooling because the pumping of the cooling water becomes unnecessary. There are 3 tables and 2 diagrams.

Experience in Operating with the Soil Evaporators GGI-500. Meteorol. i gidrologiya, No 4, 1953, pp 51-53

Results of tests of the weight evaporator GGI-500 carried out by the Poltava Arometeorological Station in 1951-1952 under field conditions, i.e., in a vaporous field and later in a field sown to winter wheat are presented. The evaporators were suspended every 5 days, and replaced by monoliths twice a month. For control, on the days of suspension the moisture of the soil was determined in the field. It was established that the evaporators of the given design are not convenient for the study of the total evaporation (soil and plants) from a field occupied by field vegetation whose roots extend deeper than 50 cm. Design improvements and accuracies are recommended in the procedure of observations which would enable one to apply successfully the evaporator to the study of evaporation of pure vapor from the surface not only for prolonged but also for shorter intervals of time. Equilibrium diagrams of silver iodide with the chlorides of metals of the first group.  
XII. V. P. Radushkevich. *J. Russ. Phys. Chem. Soc.* 62, 1043-121 (1930); *J. Russ. Phys. Chem. Soc.* 21, 1342  
An investigation was made of the equilibrium diagrams of binary systems AgI-CaCl<sub>2</sub>, AgI-  
RbCl, AgI-LiCl and AgI-CuCl, by observing the m.p.s. of these mixts., in various  
proportions. All these systems are characterized by the absence of products of double  
decompn. Systems CaCl<sub>2</sub>-AgI, RbCl-AgI and CuCl with AgI represent simple eutectics, while  
in the case of LiCl with AgI sep. layers are formed. On comparing the various diagrams  
of the above binary systems (except AgCl-LiCl, which forms layers) among themselves  
and also with systems AgI-KCl, AgI-AgCl, investigated by other workers, it is found  
that there is a close relationship between the character of the diagrams and the mutual  
solubility of the components on one hand, and the value of heat of formation of these salts  
on the other.

Polymetric equilibrium diagram of the complex system: chlorides, bromides and iodides of sodium and potassium. V. P. Radishchev. *Ibid.* 455-60. The method of thermal analysis was used in investigating the temp.-compr. relation of the system: KCl-KBr-KI-NaCl-NaBr-NaI. The system is represented graphically by means of a right triangular prism, having equilateral triangles as bases and squares

*V*

as faces. The components of the system are so arranged that the Na salts are at the corners of one base and the K salts at the corners of the other. The side edges of the prism represent the pairs NaCl-KCl, NaBr-KBr and NaI-KI. The interior of the system was investigated by means of 4 sections, perpendicular to the bases and passing through the lateral edge NaCl-KCl at 25, 40, 50 and 75 mols. % bromides, the rest being iodides. The interior of the prism was found to contain (1) a field of unlimited solv. of salts in solid state and (2) a field where this solv. is interrupted. Field (1) occupies the greater half of the prism, beginning between about the 20 and 80% sections and extending to the NaCl-KBr line, and field (2) is situated near the system KCl-NaI.
